ABSTRACT

1.1 Problem Background

Large social events and weddings generate thousands of group photographs where individual attendees struggle to locate images that contain them. Organizers and participants face time-consuming manual searches across albums, inconsistent tagging practices, and privacy concerns when third parties manage photo libraries. Existing tools often lack efficient identity-matching tailored to event-scale datasets and provide limited control over ownership metadata or consent. This fragmentation complicates copyright attribution, archival retrieval, and personal memory preservation for attendees who wish to claim, share, or document photographic ownership after events.

1.2 Objective of the Project

The main objective of the project, EventSnap – Where Every Face Finds Its Photo, is to help users easily identify and retrieve event or wedding photographs in which they are present. The system is designed to reduce the effort and time required for photo searching by allowing a user to upload a single image or selfie and automatically detect matching photos from a larger collection of event images, while preserving copyright metadata and user consent controls.

1.3 Proposed Solution / System Overview

The proposed system, EventSnap – Where Every Face Finds Its Photo, is designed to make photo searching simple and smart. In this system, event or wedding group photos are uploaded to the website, and users can upload their own selfie or single image as input. The system then compares the uploaded face with the faces present in all the group photos and shows the matching results. The main parts of the system include image upload, face detection, face matching, result display, and photo management. All these components work together to make finding personal photos much faster and easier. Together these components support copyright documentation and ownership clarity.

1.4 Key Features or Functionality

The platform offers features like one-time selfie upload, automatic face matching, quick search results, and preview of identified photos. Users can download their matched images and maintain personal access to their event memories. It also allows secure storage of image-related metadata, helping in copyright tracking and ownership clarity. Privacy controls ensure that users' personal data and images are handled safely within the system. It also offers a simple and user-friendly interface for fast searching and easy access to identified photographs. The platform is especially useful for weddings, events, college fests, and parties where many group pictures are taken.

1.5 Technology / Method Used

The project uses image processing and face recognition techniques to identify and compare facial features. The system is based on computer vision methods for face detection and face matching. It may be implemented using modern web technologies for the frontend and backend, along with machine learning or facial recognition libraries for accurate comparison and retrieval of photos, and the system is supported by a web-based platform for uploading, managing, and displaying images. It may also use secure cloud storage, image preprocessing, and efficient search techniques to handle large image datasets. Privacy and consent handling are supported through encrypted metadata and access control mechanisms.

1.6 Expected Outcome & Benefits

The expected outcome of this project is a smart and efficient photo search platform that can quickly identify all group photos containing a specific user. The system will reduce manual effort, save time, and improve the overall photo search experience. It will also help maintain better copyright records, support user privacy, and provide clear ownership information for event photographs. In this way, the platform benefits both attendees and event organizers. Overall, it improves user convenience, saves time, and provides a better way to manage personal event memories.

1.7 Original Contribution Statement

The originality of this project lies in its simple but practical idea of helping users find themselves in a large collection of group photos using just one selfie. Instead of depending on manual search, the system provides an automated and user-friendly solution. EventSnap focuses on making memories easier to access by connecting face recognition technology with real-life event photography needs. The idea of simplifying event photo discovery through intelligent face-based matching makes EventSnap a practical and innovative solution.

1.8. Current Development Status

The project is currently in the advanced development stage with major modules implemented and ongoing refinements.

Progress Overview

- Backend API:  Mostly Implemented
- Frontend UI:  Developed (UI improvements ongoing)
- Database Integration:  Completed
- AI Pose Detection:  Partially Integrated & Testing
- Testing & Optimization:  In Progress

1.9 Work Completed So Far

1.1 Backend Development

- REST API structure implemented
- User authentication (JWT-based)
- Database schema design completed

1.2 Frontend Development

- Dashboard UI created
- Exercise library interface implemented
- Basic navigation and routing completed

1.3 Core Features Implemented

- User Registration & Login
- Exercise listing and categories
- Basic session tracking
- Camera access implemented
- Accuracy tracking under testing phase

2.0 Modules Under Development

The following components are currently being improved or finalized:

- Real-time pose correction system
- Smart break scheduling logic
- Advanced analytics dashboard
- Notification system
- UI/UX refinements

2.1 Work Remaining

- Complete AI model optimization
- Improve accuracy scoring system
- Implement advanced analytics
- Perform full testing (unit + integration)
- Deployment setup

2.2. System Architecture

The system follows a three-tier architecture:

- Frontend: React.js
- Backend: Express.js
- Database: MongoDB Atlas

2.3 User Flow (Current Implementation)

- 1.Landing Page
- 2.Enter Event Code
- 3.Take Selfie / Upload Photo
- 4.Search Match
- 5.Photo Gallery

2.4. Use Case Progress

Major use cases implemented:

- User Registration & Login
- Dashboard
- Create Event

Use cases under development:

- Advanced Progress Analytics
- Real-time AI Feedback

2.5 Screenshots (Work in Progress)

1.1 Login/Signup page

1.2 Event Code Page

1.3 uplope selfie

1.4 photos found

1.5 Landing Page

2.6 Code Implementation

```

1 import React from 'react';
2 import { Link } from 'react-router-dom';
3 import { Camera, Sparkles, ArrowRight, Users, Zap, Shield } from 'lucide-react';
4 import { motion } from 'framer-motion';
5
6 export default function Hero() {
7   return (
8     <section className="relative min-h-screen bg-slate-950 flex flex-col overflow-hidden">
9       {/* Background */}
10      <div className="absolute inset-0">

49      </div>
50    </section>
51  );
52}

```

2.7 Challenges Faced

Integration of real-time AI pose detection

- Performance optimization for live camera processing
- Managing state across multiple components
- Ensuring smooth user experience

2.8 Next Plan of Action

- Complete AI-based exercise correction
- Improve system performance
- Finalize analytics dashboard
- Conduct full system testing
- Prepare for deployment

2.9 Expected Completion

The project is progressing as planned and is expected to be fully completed within the university's given timeline.

3. Conclusion

EventSnap is currently in an advanced stage of development with core functionalities already implemented. Remaining modules are under active development and testing. The project shows strong potential to deliver an effective and innovative solution for workplace wellness upon completion.
